Package Management and Software Supply Chain

Here are all the commands we used earlier to restore the wifi/bluetooth drivers and network tools that the BOSS hardening scripts deleted:

1. Restore WiFi & Bluetooth drivers
The hardening scripts did `rm -rf` on the kernel's wireless and bluetooth driver directories. To get them back:
```bash
apt-get --reinstall install linux-image-$(uname -r)
```
Or if that doesn't work:
```bash
apt-get --reinstall install linux-modules-$(uname -r)
```

2. Restore the deleted network tools
```bash
apt-get --reinstall install openssh-client openssh-server nano util-linux
netcat-traditional openvpn samba nfs-common remmina
```

3. Re-enable the USB storage module
Since the kernel module was deleted:
```bash
apt-get --reinstall install linux-image-$(uname -r)
modprobe usb-storage
```

4. Load the WiFi drivers after reinstall
```bash
modprobe cfg80211
modprobe mac80211
```
Then check if WiFi shows up:

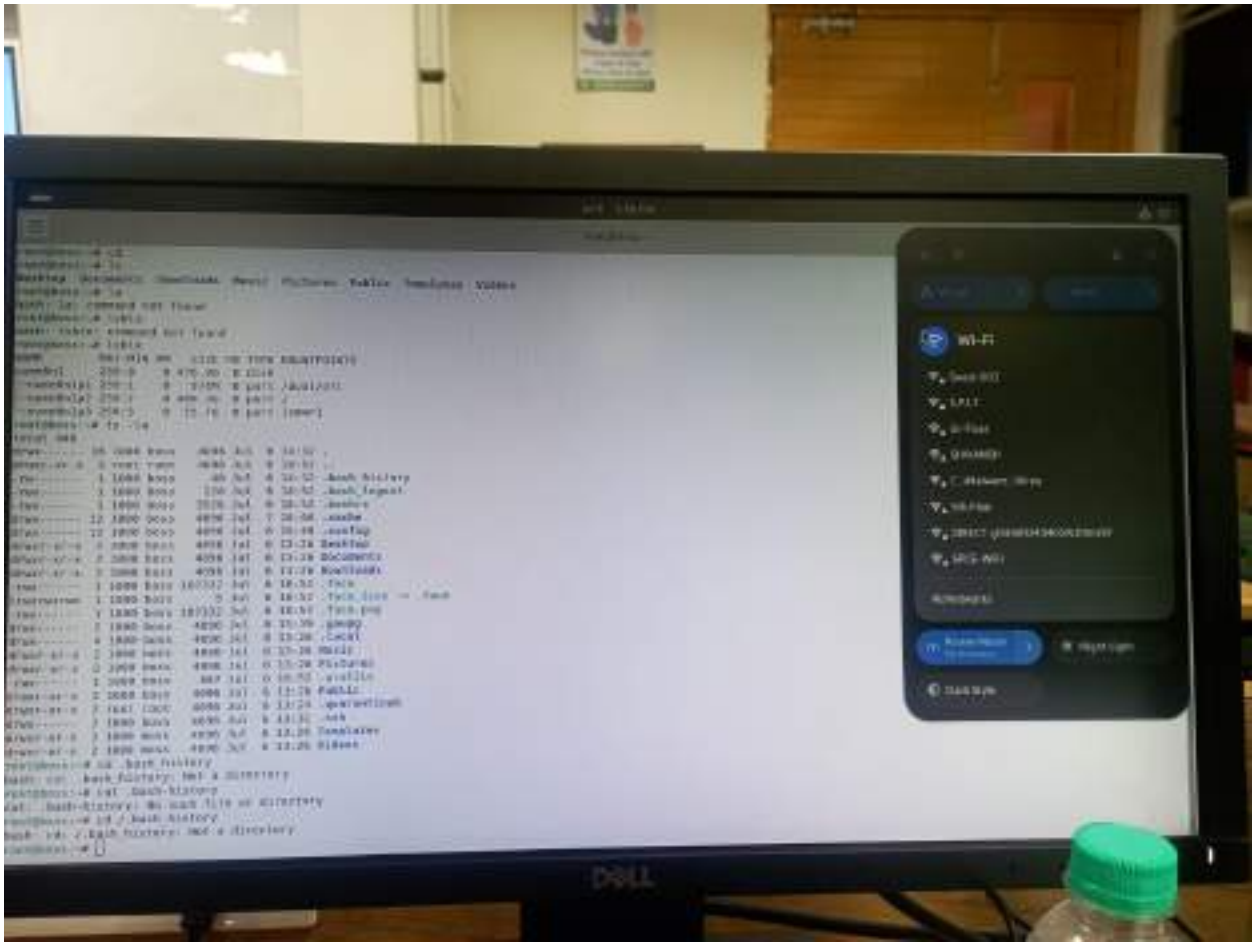

```bash
ip link show
iwconfig
```

5. Scan for WiFi networks
```bash
nmcli device wifi list
```

6. Connect to a WiFi network
```bash
nmcli device wifi connect "NETWORK_NAME" password "PASSWORD"
```

7. Check your current network status
```bash
ip addr show
ip route show
cat /etc/resolv.conf
```

📸 If the WiFi drivers come back and you can see wireless networks, that's another great demo for the judge — it proves the hardening was reversible!
